

Causal effects: media and China-factor interventions

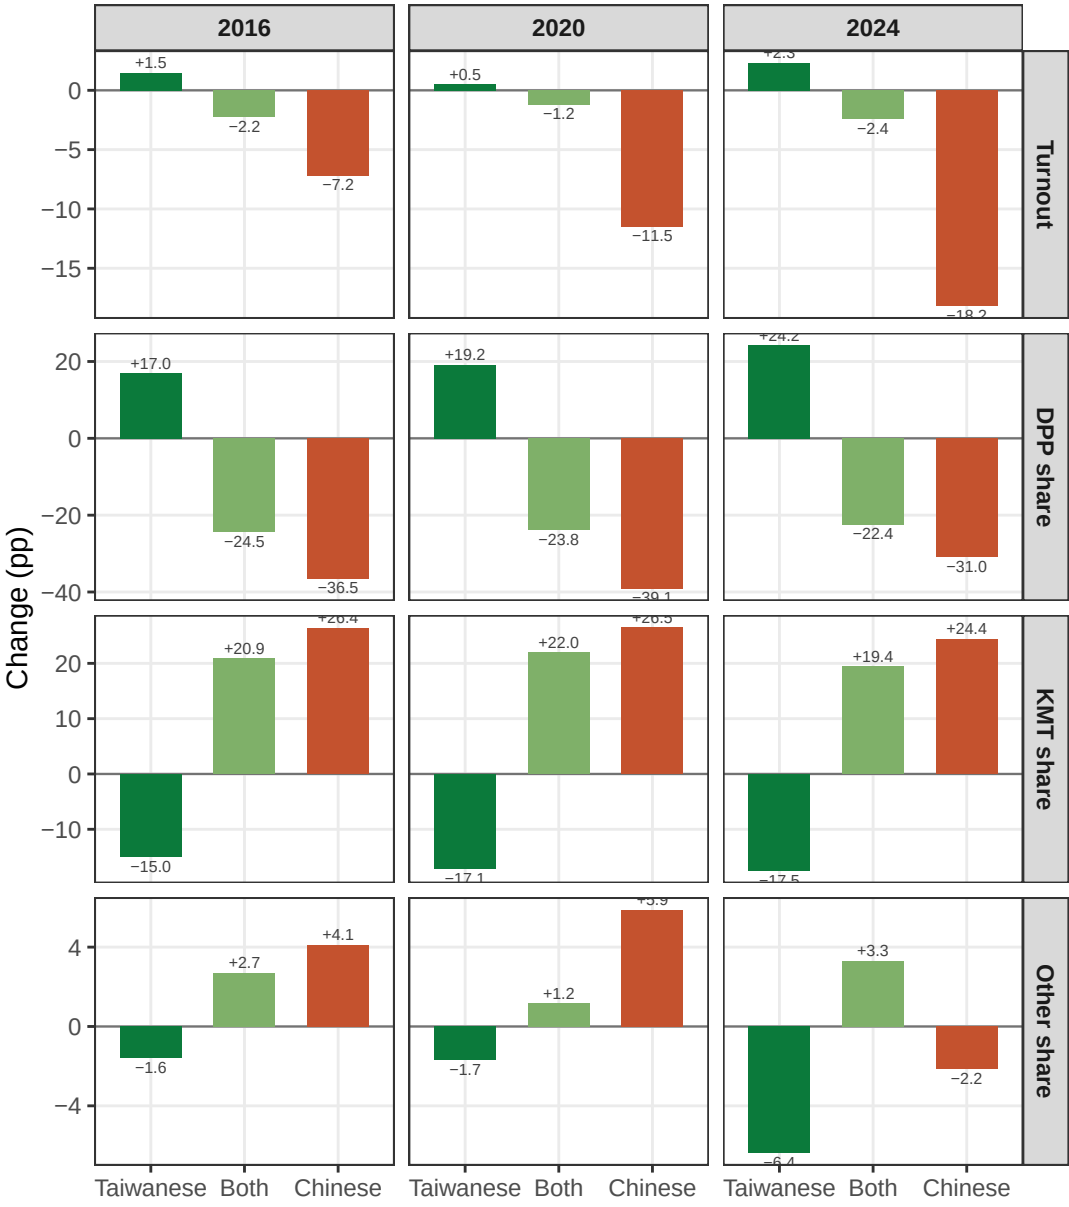

The identity and tondu interventions have no US counterpart

Causal effects of media exposure interventions

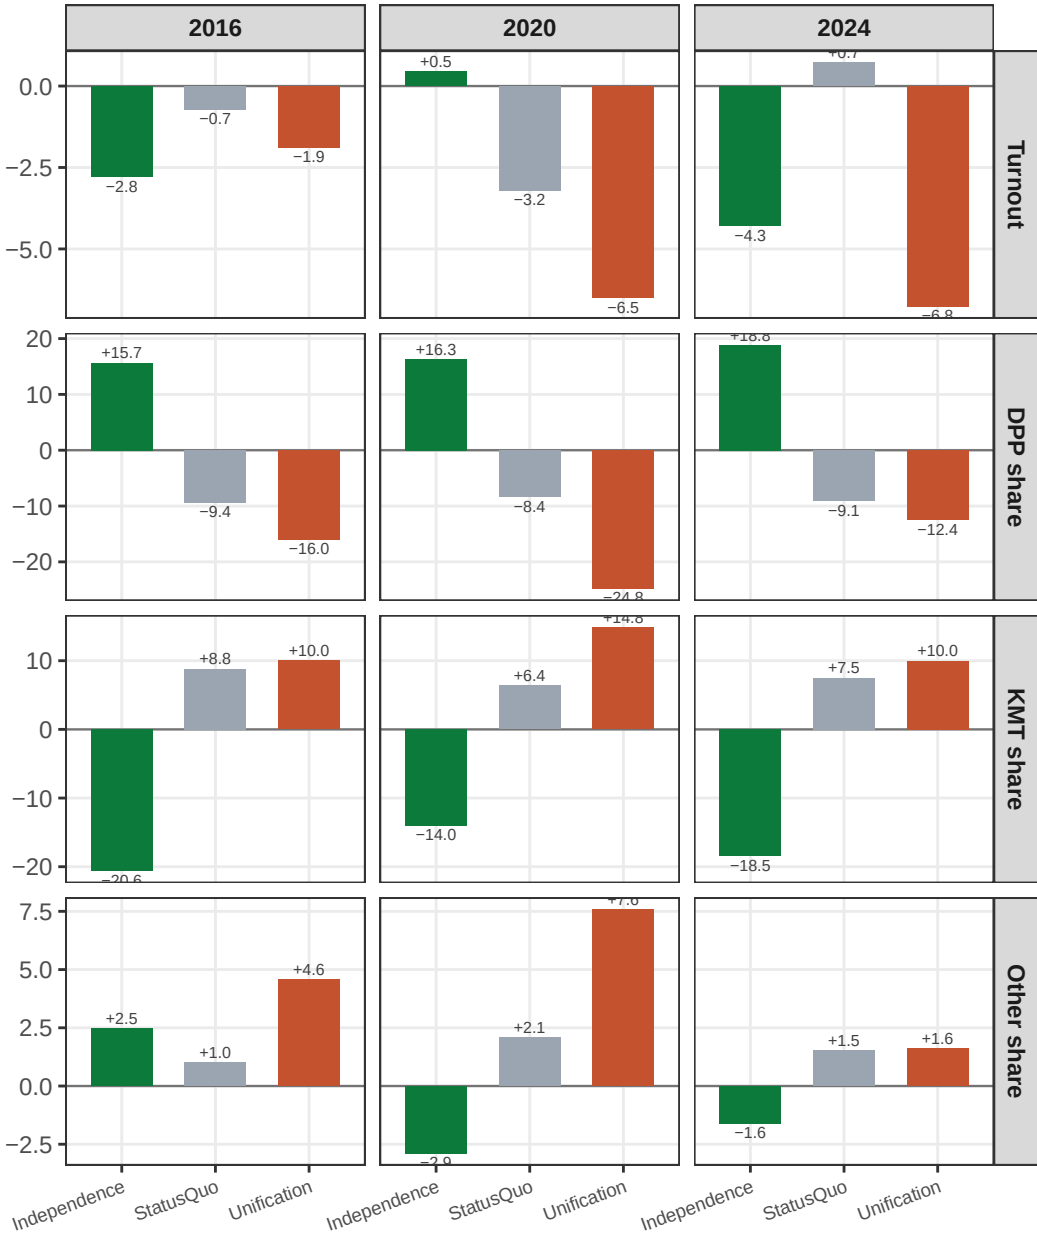

Percentage-point change from baseline under $do(\text{MediaExposure} = m)$

$do(\text{Identity} = i)$

$do(\text{Tondu} = t)$

Estimated by graph mutilation (Pearl 2009): all edges into MediaExposure are removed before sampling, which is what distinguishes $do(M = m)$ from conditioning on $M = m$.
