

Validation suite: TEDS synthetic data

Vote choice: observed vs synthetic

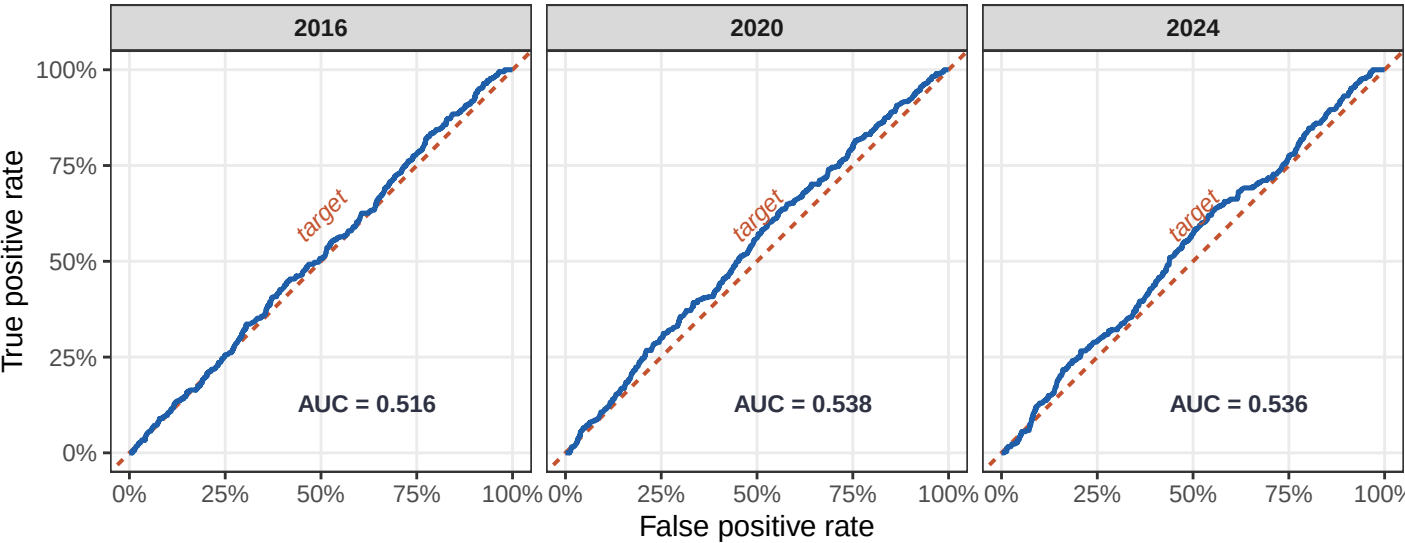

Ko Wen-je's 2024 candidacy makes 'Other' a full category, not a residual

Third-force share: Soong 12.8% (2016), Soong 4.3% (2020), Ko 26.5% (2024). The US application could treat Other as a residual; the Taiwanese case cannot.

Adversarial classification: can a classifier tell synthetic from real?

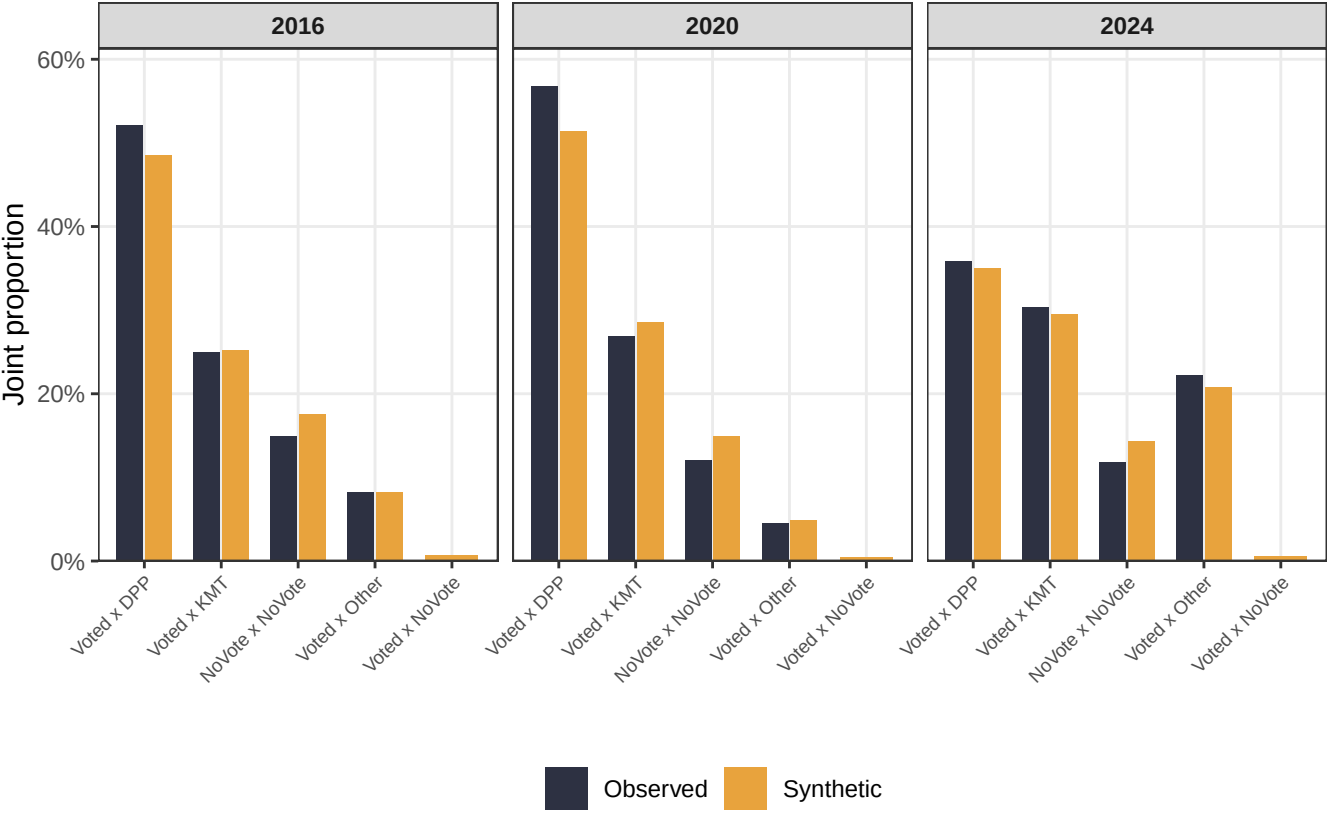

Here the diagonal is the GOOD result -- it means the two are indistinguishable

Note the inverted reading. In prediction tasks AUC -> 1.0 is success; in synthetic-data validation AUC -> 0.50 is success. A curve bowing toward the top-left would mean the synthetic records carry detectable artefacts.

Joint distribution: turnout x vote choice

Structural zeros are enforced by construction, not filtered post hoc

Inferential utility: DPP vote model on observed vs synthetic data

Overlapping intervals indicate preserved inference
